[PD] Feedback and Code Review

Code review is probably one of the most important things in software development. I can recall the code review I received very recently on one of the week's exercises I did, I was sure about a few things and I thought that I had gotten everything right and until I actually got the feedback I didn't realize the small mistakes I made and some confusions I had at the same time Getting that code review definitely helped me understand everything in a better way.
Feedback is also really important because it gives you a different perspective on how things are done. Getting feedback also enables us to understand different methods of doing the same thing but maybe more efficiently. It can also highlight some strengths and some development areas at the same time and one can really work on it from there. I would have liked to know at the start of the course that it really helps to get a different perspective on how you are used to doing things that can always be improved. Getting feedback as frequently as possible will really help you learn more.
